

Attendance System Using ID Scanner

Introduction

This document describes an attendance system that uses ID scanning technology to record and manage student or employee attendance efficiently.

Objective

The main goal is to automate attendance tracking using QR or barcode-based ID scanning, reducing manual errors and improving efficiency.

System Overview

Each user is assigned a unique ID encoded in a QR code or barcode. At the entry point, the ID is scanned using a mobile device or scanner. The system verifies the ID and records attendance in real time.

How It Works

1. User shows ID (QR code). 2. Scanner reads the code. 3. Data is sent to the server. 4. Server verifies user. 5. Attendance is recorded. 6. Access is granted or denied.

Components

• Scanner Device (phone or hardware) • Backend Server • Database • Admin Dashboard

Advantages

• Fast and accurate • Reduces manual work • Real-time tracking • Easy reporting

Conclusion

The ID scanner attendance system is a reliable and scalable solution for modern institutions, providing secure and efficient attendance management.
